Constraints Journal

Helmut Simonis

2026-07-21

1 Introduction

This reports is generated by the literature survey tool I developed to produce overviews of specific topics in the Computer Science literature. In this case, we start with a full bibtex file of all "Constraints Journal" publications obtained from DBLP. This covers 570 entries, this includes editorials, errata, letters, and other special types. The DBLP dataset does not include 2025 publications. We refer to the papers by a key generated by DBLP, which consists of the name of the first author, the first character of the names of any other co-authors, and a two digit year code.

The literature survey tool is intended to find all related papers on a specific combination of topics, by looking up citations and references, finding those that are relevant to the topic, including them in the survey, and iterating this process until a fix-point is reached. In this specific case, we only include the articles in the original set.

The publications in the Constraints journal fall into several sub types:

Regular technical or application papers, full length submissions, the annotation of application papers is not very consistent

Editorial editorial messages, often an introduction to a special issue by guest editors

PhDA PhD thesis announcements, one or two page abstracts of PhD theses published in the Constraints area

Letter short submissions, sometimes technical

Errata corrections of previously published material

Survey survey articles

Viewpoint position papers, often short in length, typically part of a special issue

Benchmarks description of benchmark problems

We also try to distinguish the origin of papers:

special issue papers are published under a specific call, some special issues are collections of papers from a conference, other are for a specific topic

linked papers are based on a previous conference submission, the conference is shown in the listing. In many cases, the paper itself indicates the link in the running text, in others we find this by looking up papers by the same author team with the same (or very similar) title on DBLP.

original original content directly submitted to the journal. In many cases, an earlier version of the text is published on arvix, we do not see this as a linked paper.

We look up cited and referred papers using three databases:

OC OpenCitations, an open-access repository of links between publications with a DOI

XR CrossRef, a non-profit association of publishers

SC Scopus, a scientific citation database owned by Elsevier

The reference and citations counts between these databases differ, sometimes significantly. OpenCitatons only links publications with known DOI, some journals and conferences are not indexed by some of the databases, older material may not be included, etc.

We also consider links between works included in the survey, for this specific survey this only considers journal self-citations. In some cases these journal self-citations are considered problematic, this does not seem to apply in the context of the Constraints Journal, published over a period of 30 years.

The first plot shows the evolution of the number of works published over time. As the survey only covers a single journal, every paper is published by Springer.

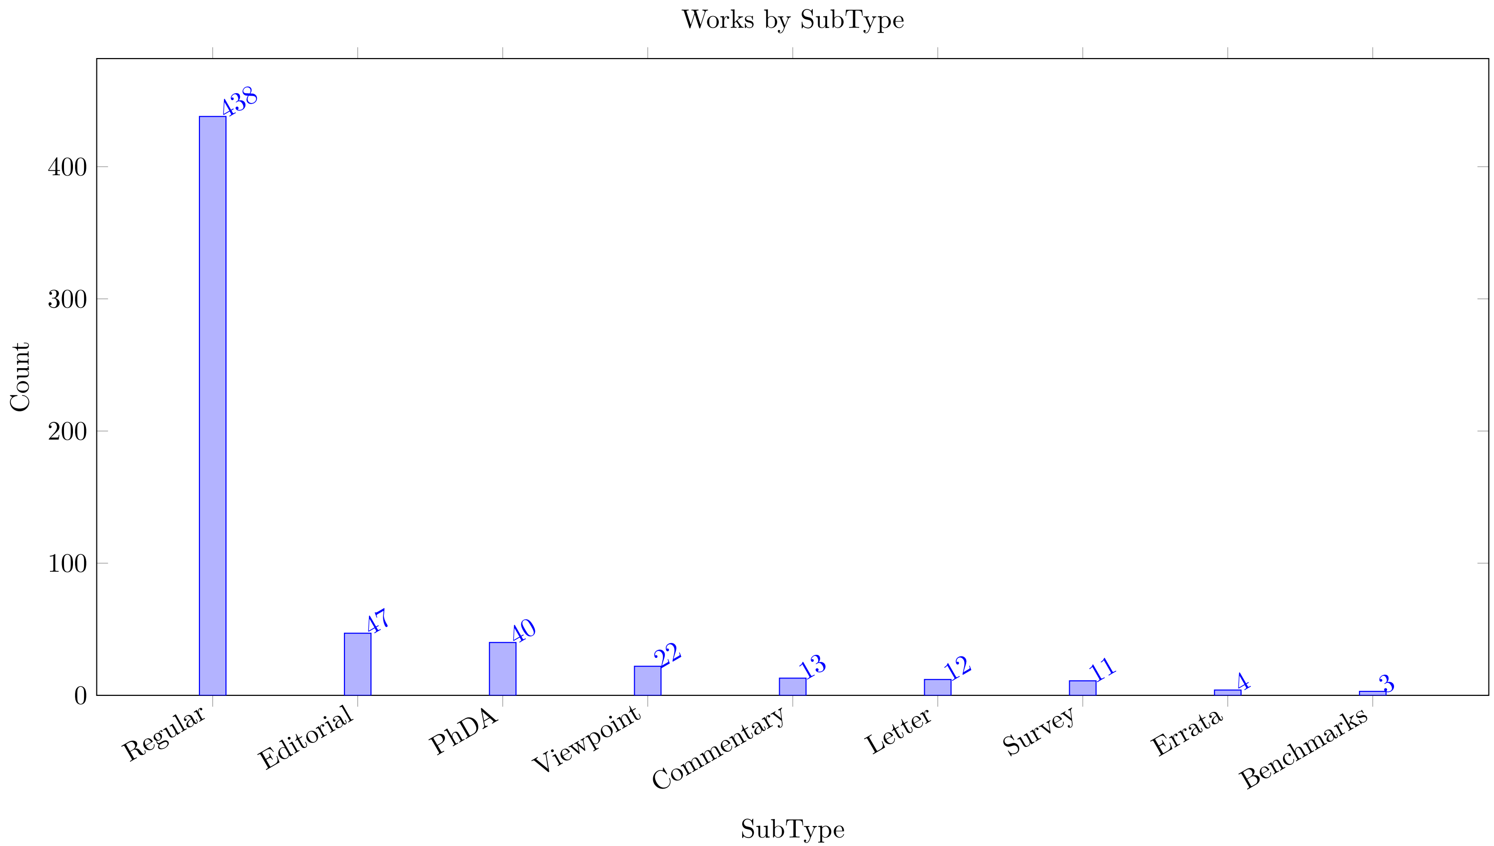
The next plot shows the distribution of papers by sub type.



The following Figure shows the origin of the articles by country, based on affiliation data in the Scopus meta-data. A work is counted for one country, if at least one author has an affiliation from that country at the time of publication. An article with authors from different countries will be counted multiple times, but when two authors are from the same country, the paper is only counted once for that country.

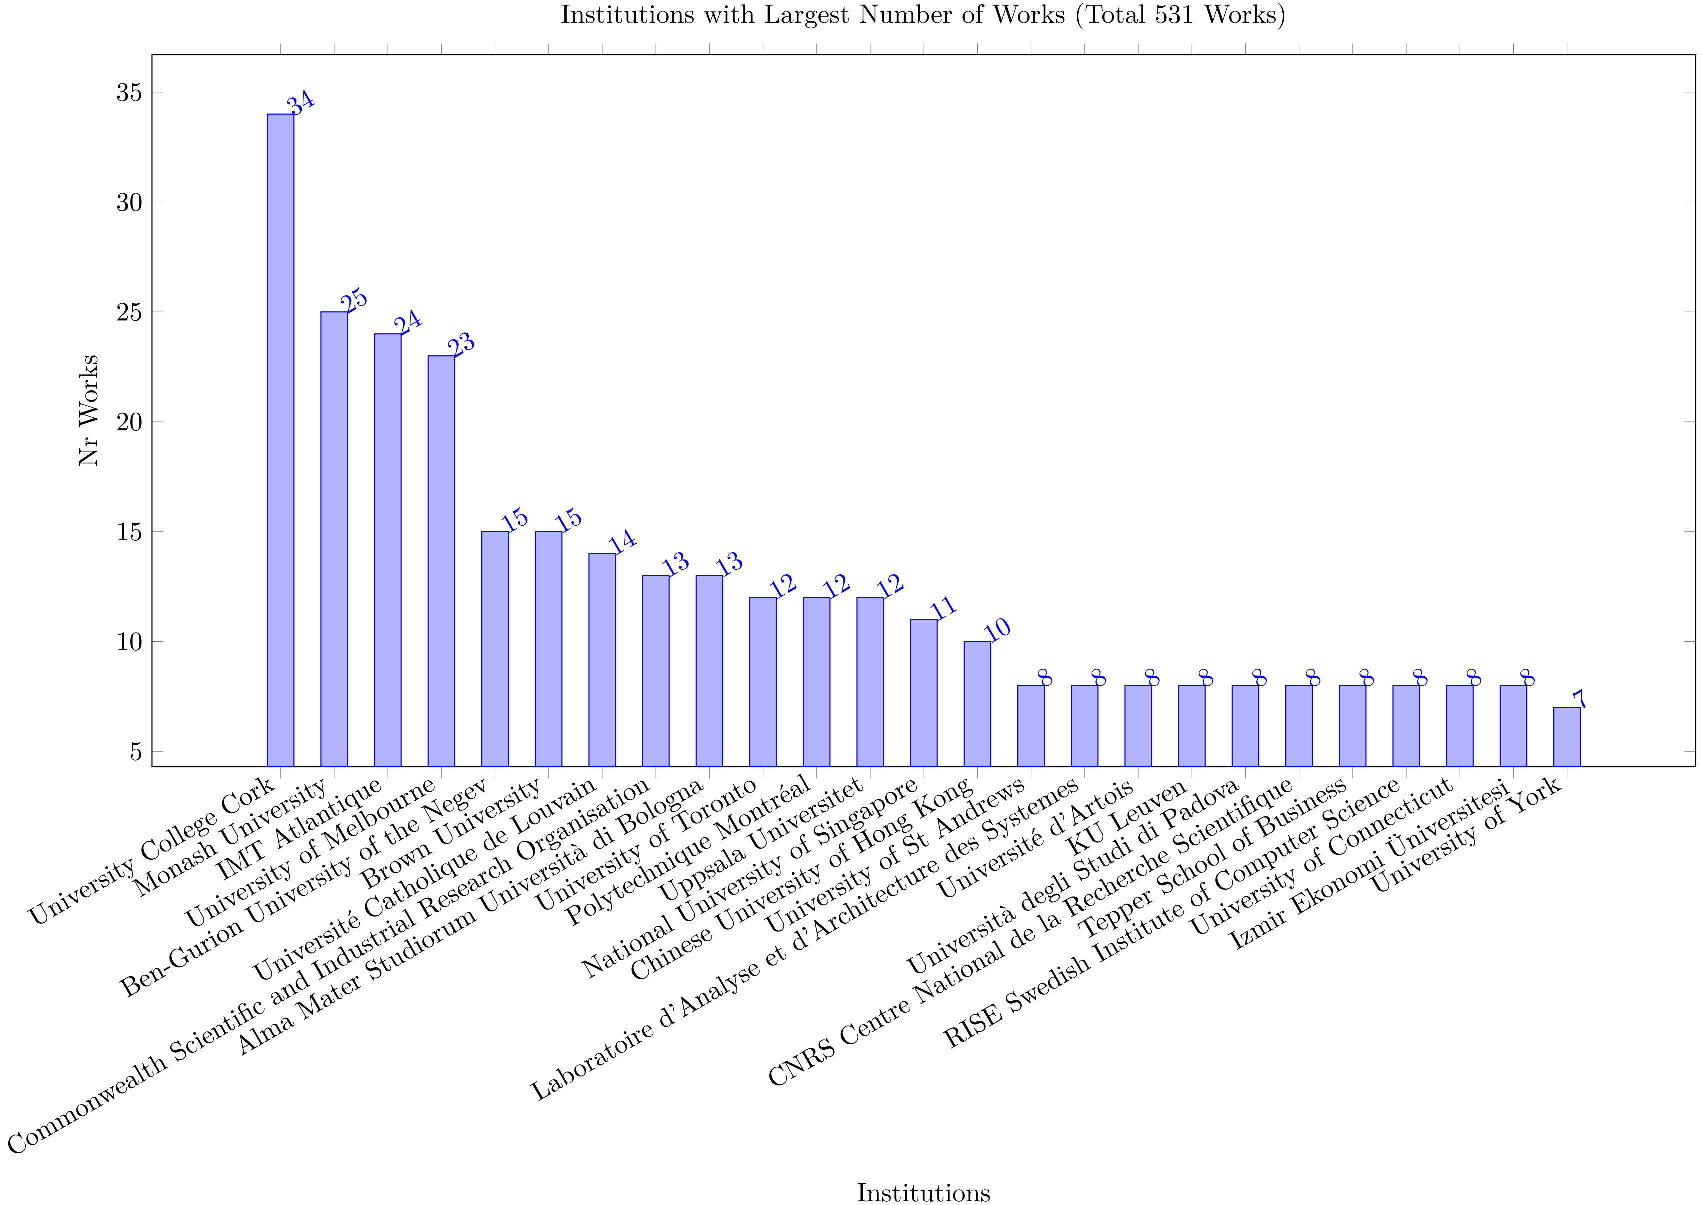
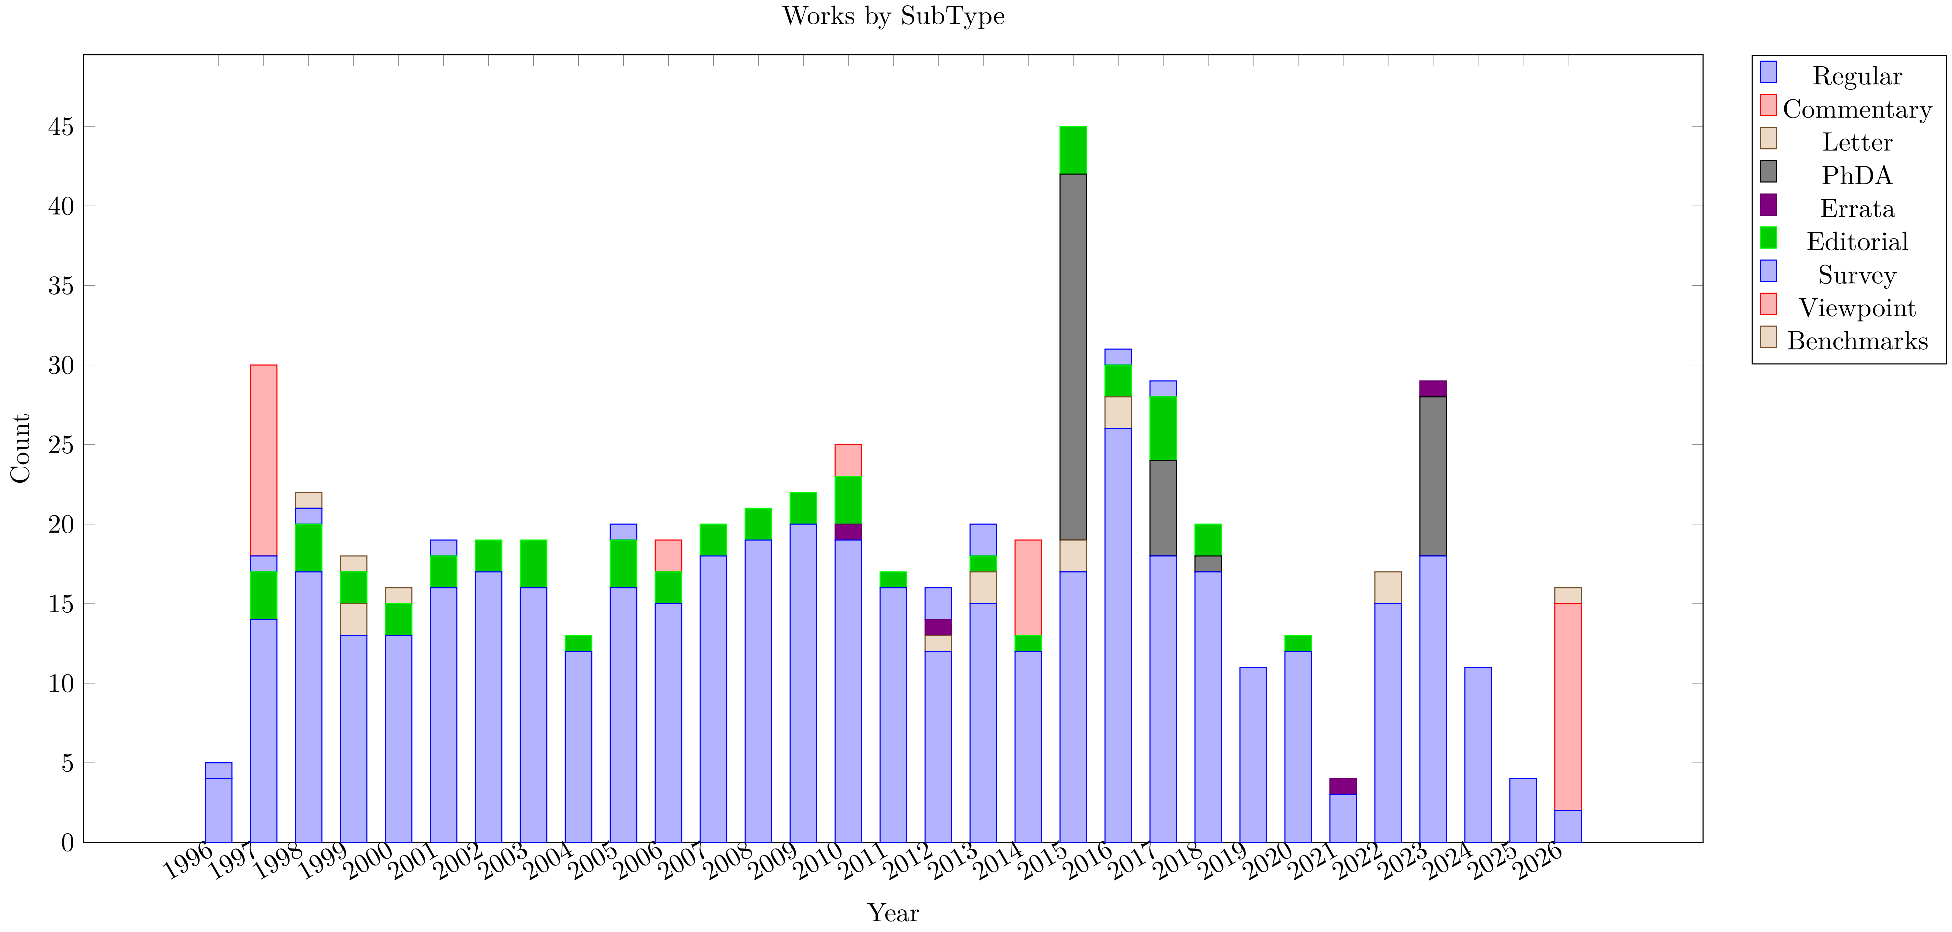
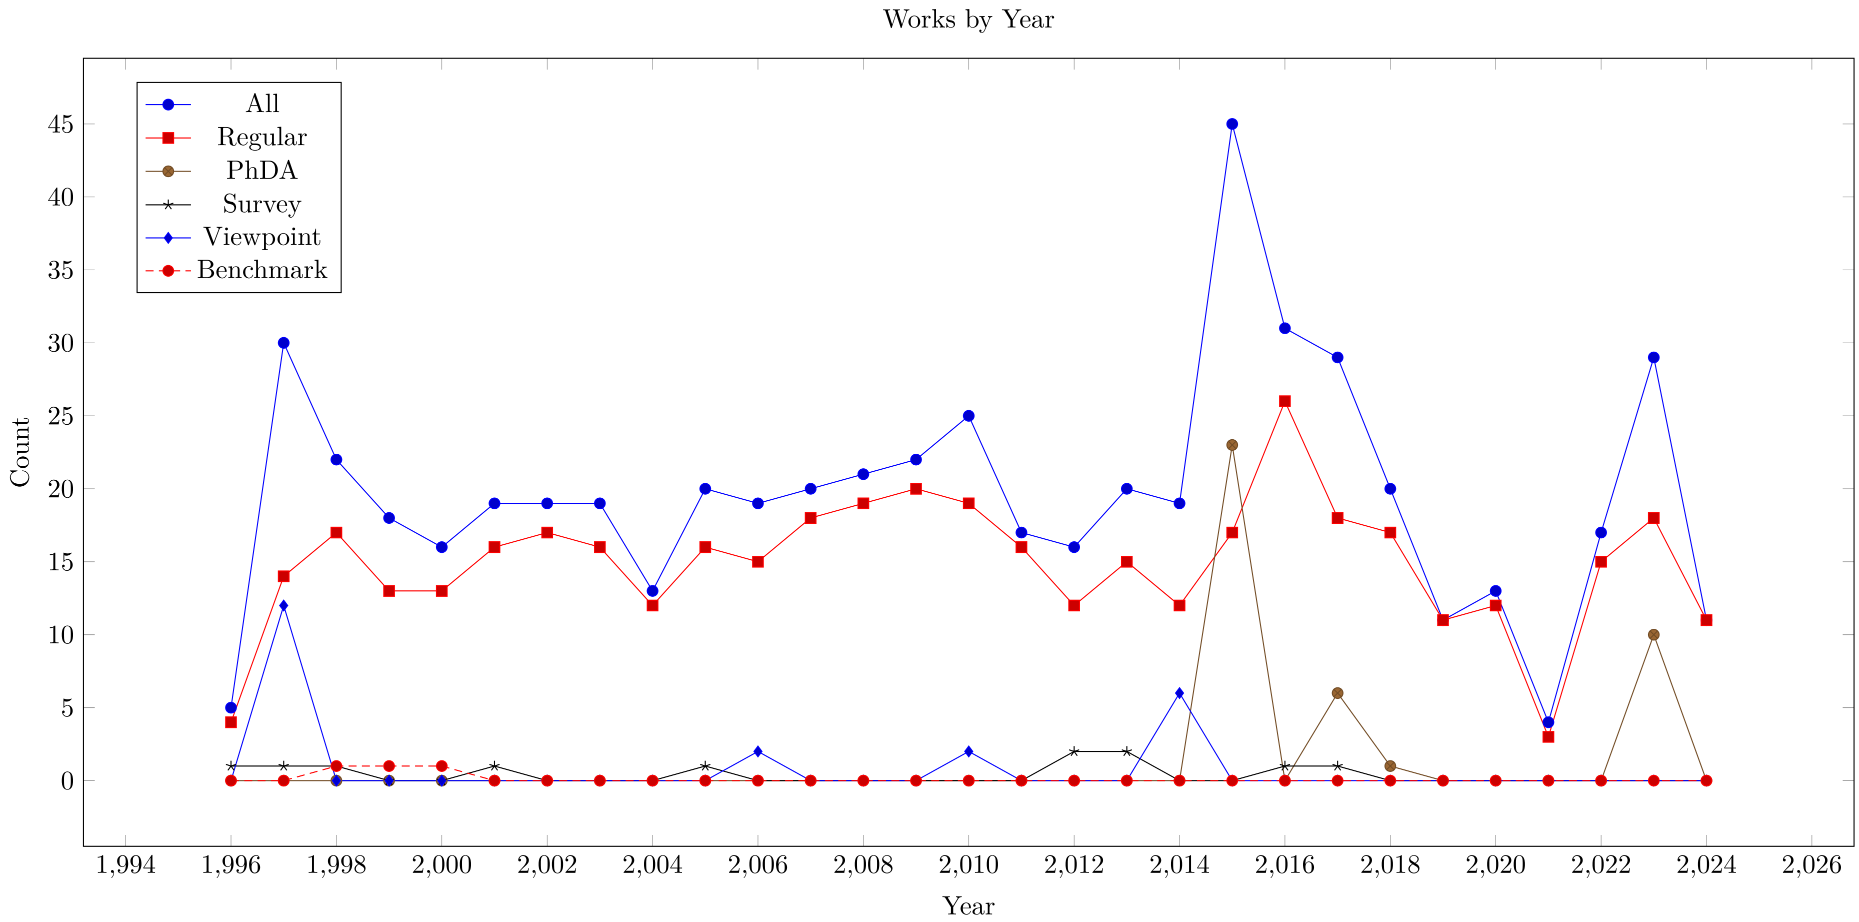
The following Figure shows the origin of the articles by Institution, based on the meta-data in the Scopus record. A potential problem is that different affiliations may be used for the same centre at the same time, or the name of the institution changes name over the period of the survey.

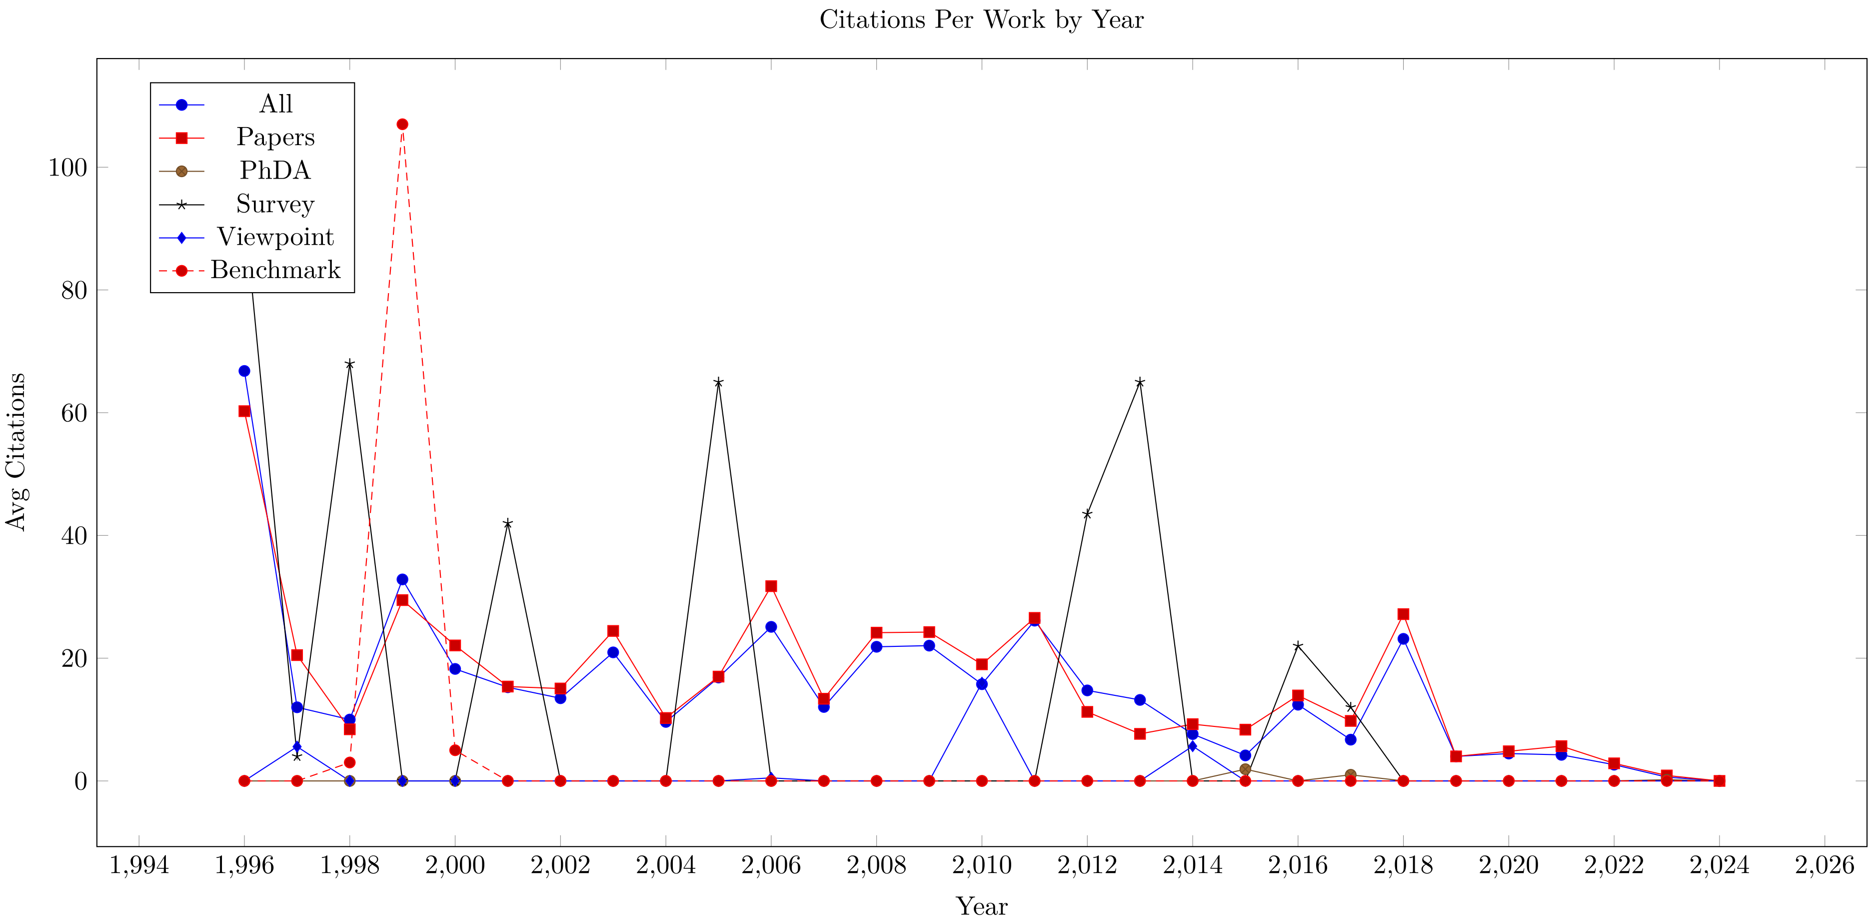


The following Figure shows the number of publications per year, split into different sub categories. We can see that while the total number of publications varies a lot over the years, the number of regular submissions is also quite variable. The number of PhD announcements in one year can be quite high, this is an artifact of the collection process, theses from multiple years may be presented in one issue together. There have been no survey or viewpoint publications in recent years.





The following Figure shows the average number of citations for the different sub types over the years. Unsurprisingly, more recent publications did not have time to accumulate many citations. We can note that surveys, while rare, often achieve a high number of citations. PhD announcements, editorials, and viewpoints do not achieve high citation counts.



The number of linked publications, which are independently submitted based on a previous conference publication has increased in recent years, since there have been no special issues based on conferences.

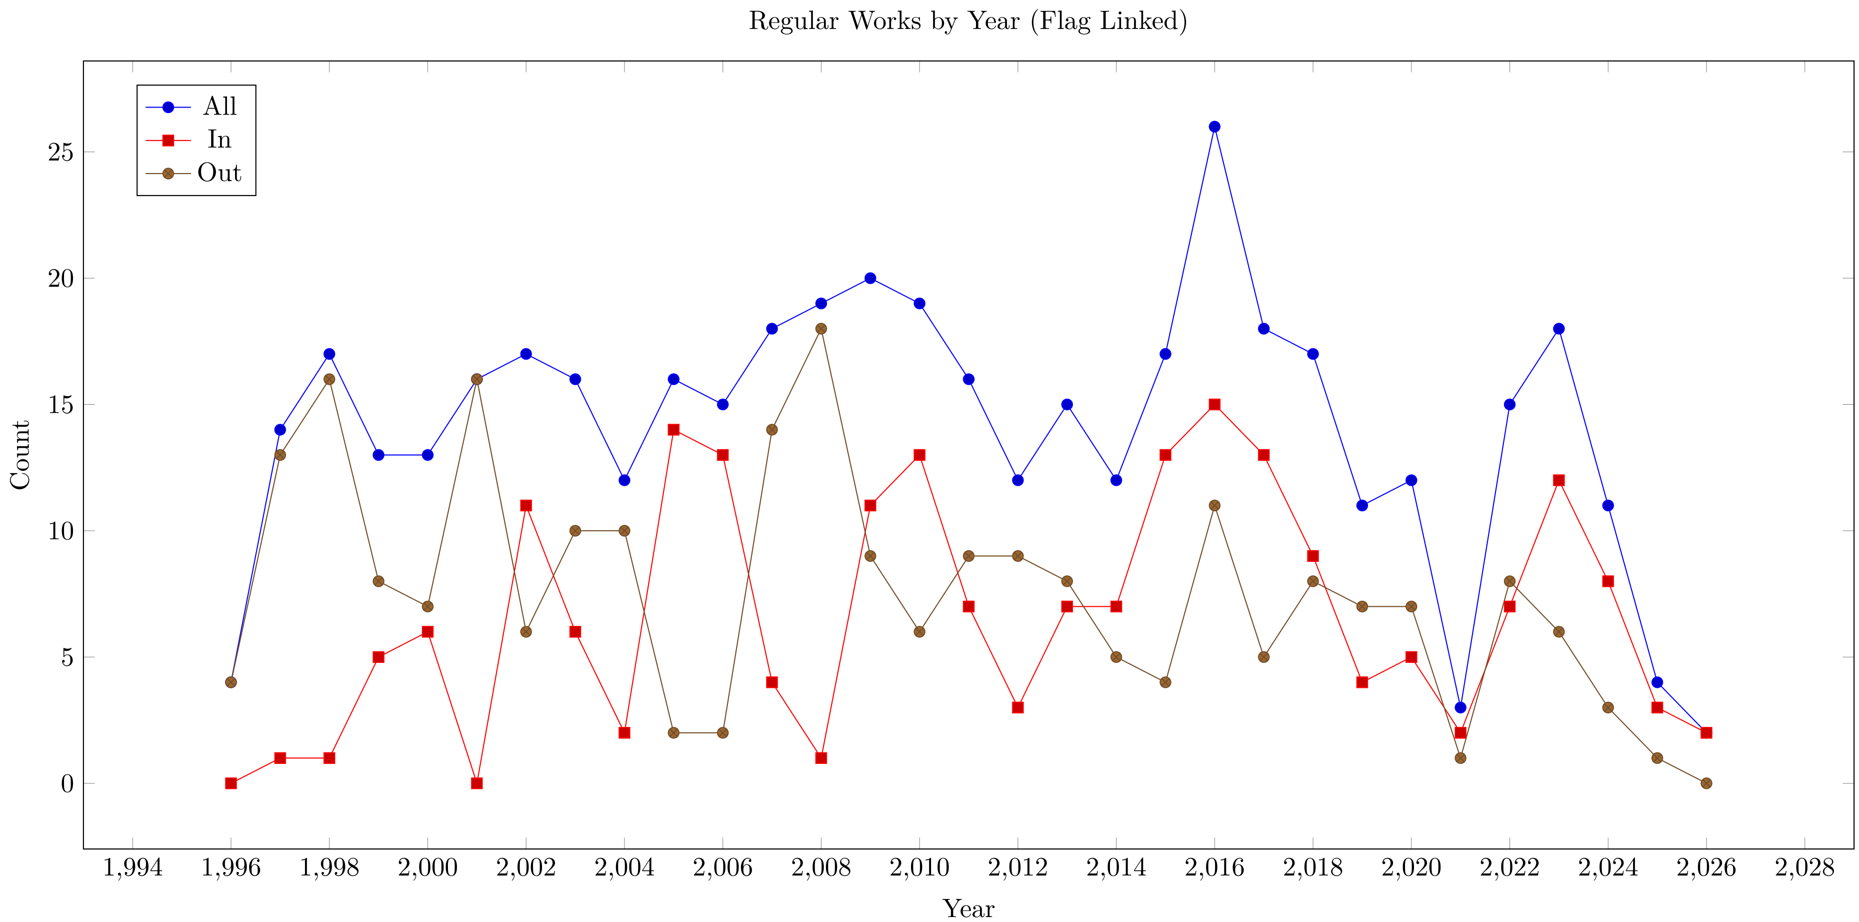
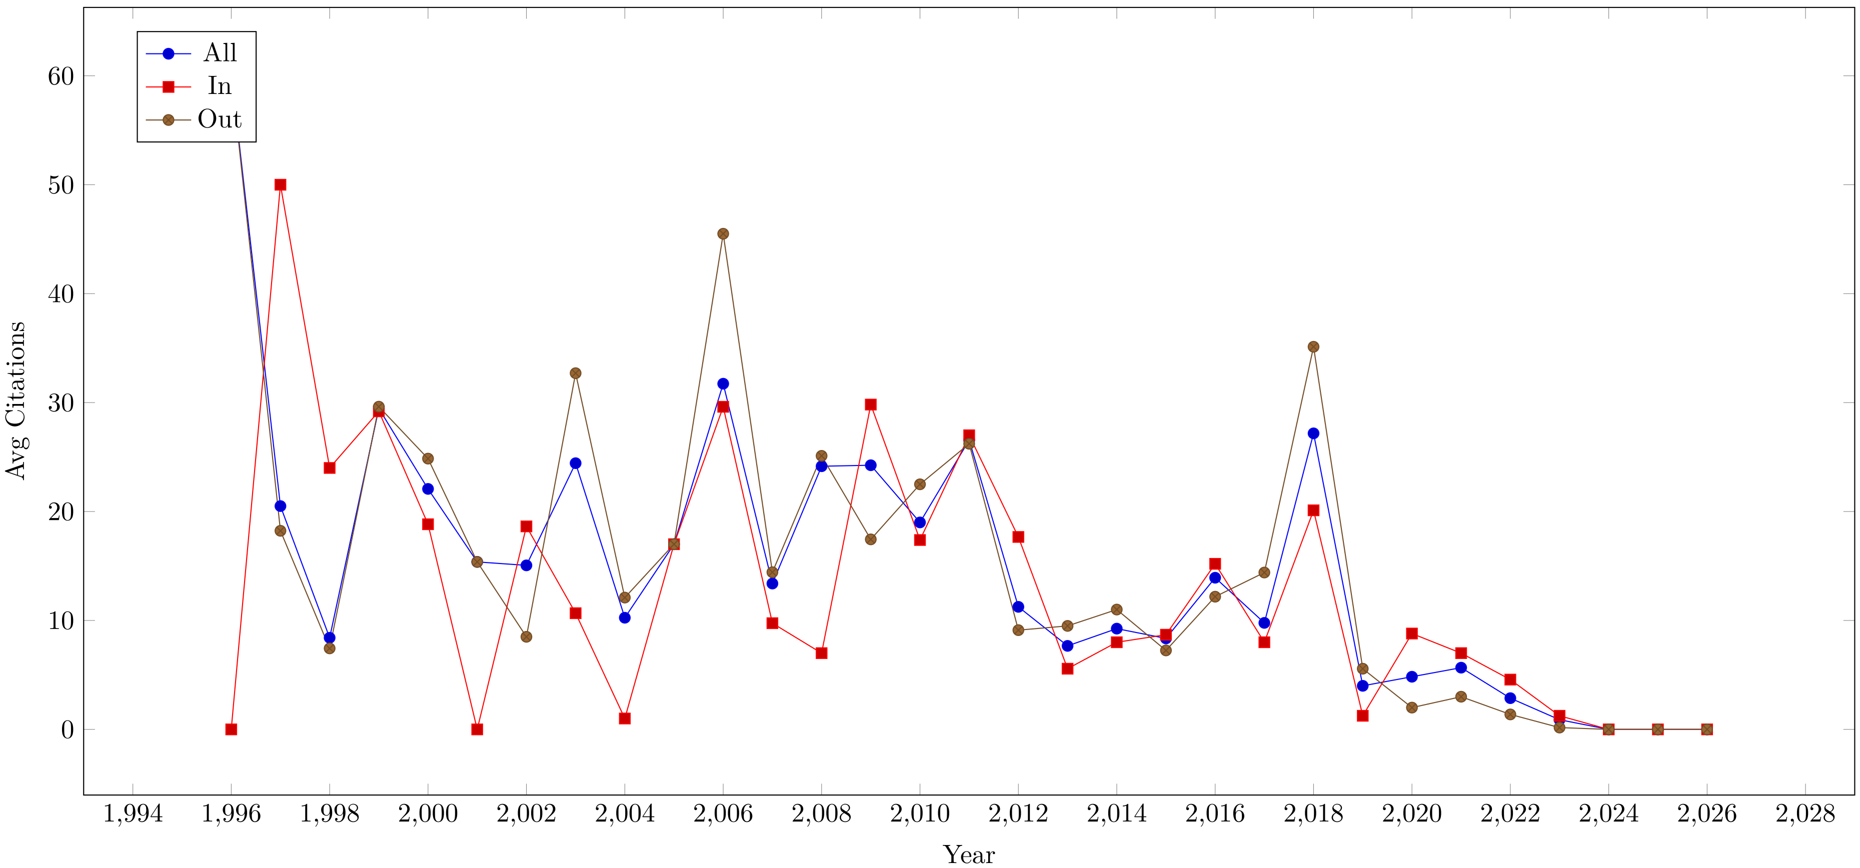
Nr Citations

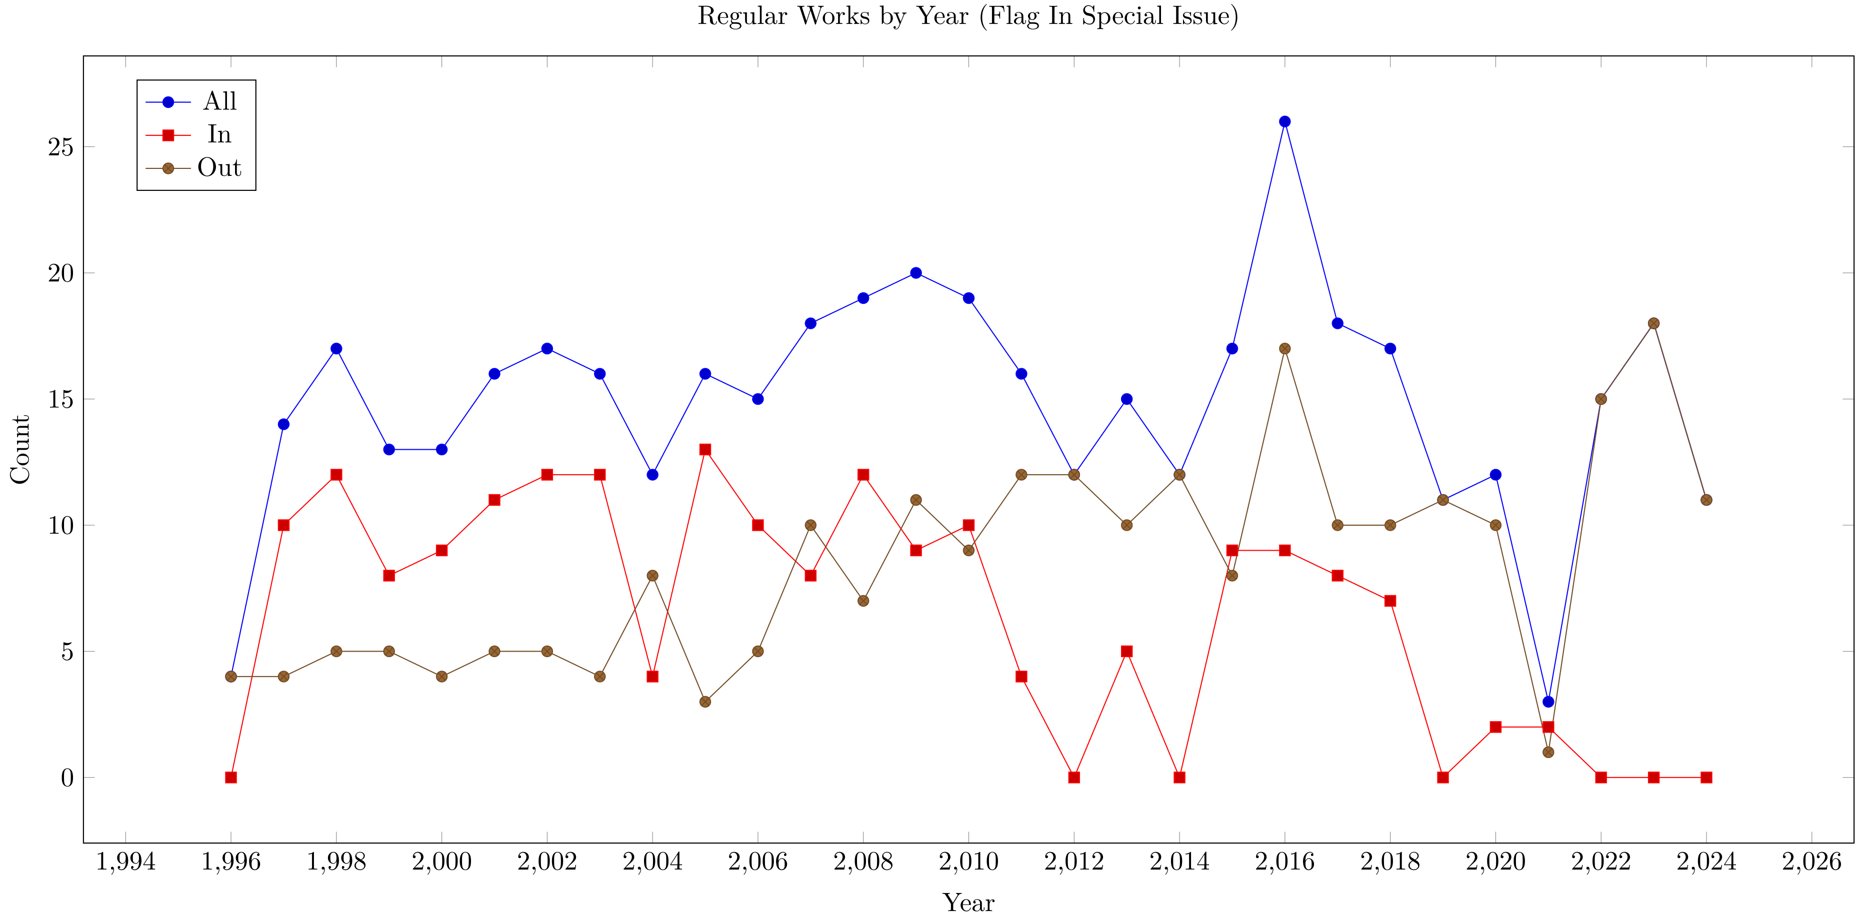


There is no clear trend when considering the average citation count of linked papers to the citation count of original submissions.

Citations Per Regular Work by Year (Flag Linked)



The number of articles in special issues has dropped to zero in recent years. This explains the poor publication numbers over the last years, as in the past a significant number of works were published in special editions.



There also does not seem to be a clear trend on whether papers in special editions attract more citations that other regular papers.

2 Journal Articles

2.1 Journal Articles from bibtex

The listing of publications is by year (decreasing), and then by alphabetical order of the article key. The different columns of the table have the following meaning:

Key/Source The assigned key of the work, and a hyperlink to the publishers website for the article

Authors The authors given in publication order, with hyperlinks to an overview of all publications of the authors in the survey

Title title of the article, the colouring indicates open-access status according to the databases, this is often incorrect in the meta-data

Details/LC Links to an overview of details for a paper, and a hyperlink to a local copy of the pdf of the paper.

Cite link to the paper in the bibliography

Year year of publication, according to bibtex entry. The first online publication may be earlier

Source/SubType the journal and the subtype of the article, regular entries are not marked

Pages/Linked/Topical number of pages, plus indication of special issue or conference for a linked paper. Entries are marked in blue for special issues, green for linked papers, red for sub types not already covered, and none for other types

Relevance relevance count for title, abstract and body text; not applicable for this survey

Cites citations from OpenCitations, Crossref and Scopus

Refs number of references according to OpenCitations and CrossRef, OpenCitations only counts entries with known DOI

Links internal links to other works in the survey, total, citations and references

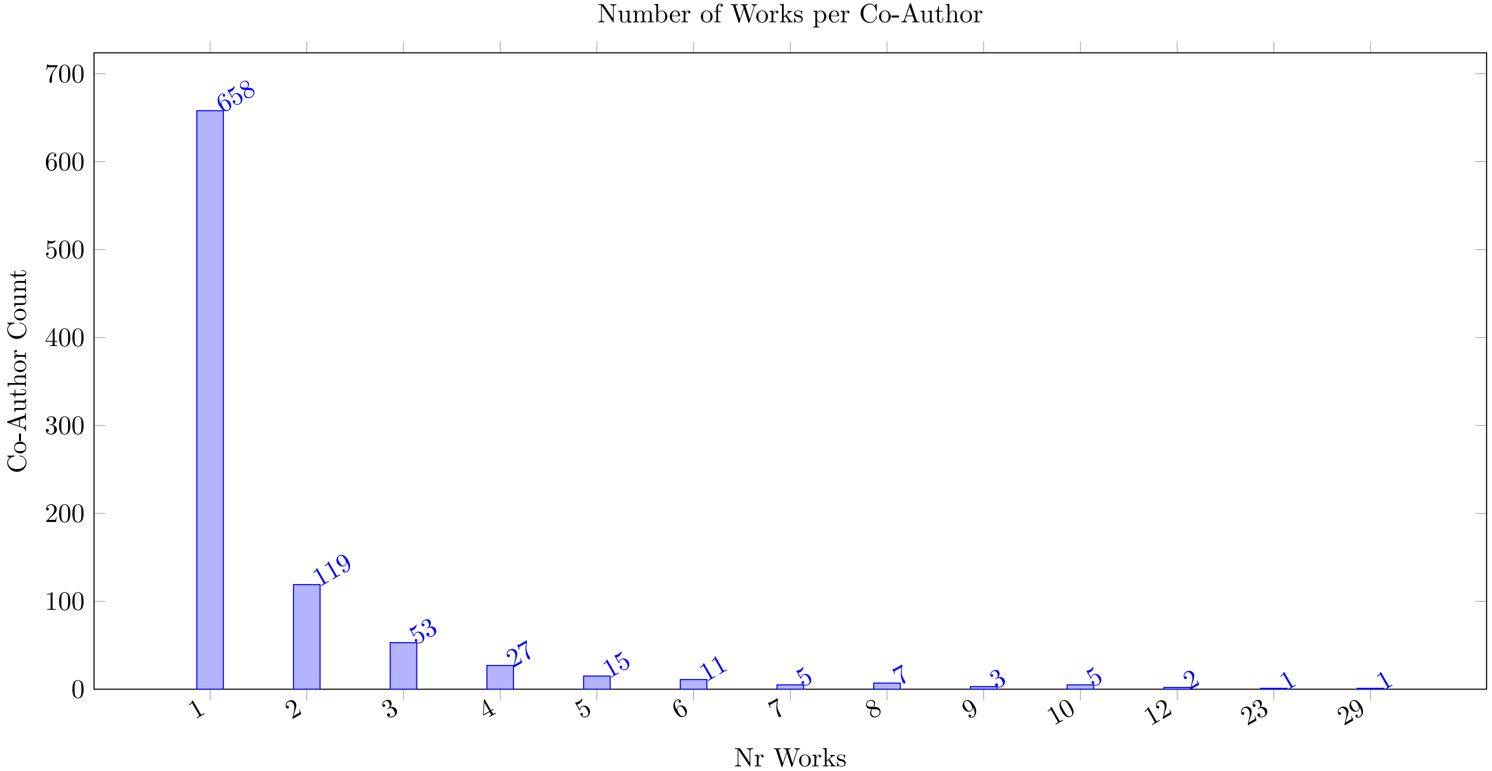
4 Works by Author

This section takes a more comprehensive look at the most prolific authors published in the Journal. We show the graph of co-authorship relations between authors with four or more publications in the survey, which shows a high degree of connectivity, even when we only consider the articles published in the journal itself.

There are quite few authors that have published a large number of papers in the journal, while many co-authors only have a single publication in the journal. This is shown in the next Figure.



The next Figure shows the percentage of regular papers that have at least one prolific co-author. We see that for example 50% of all papers have at least one co-author that has published four or more papers in the journal. A quarter of the regular works have at least one co-author with eight or more published articles (that is a group of 19 authors).

On the other hand, over 20% of all papers are published by teams that have never published a paper in Constraints before.

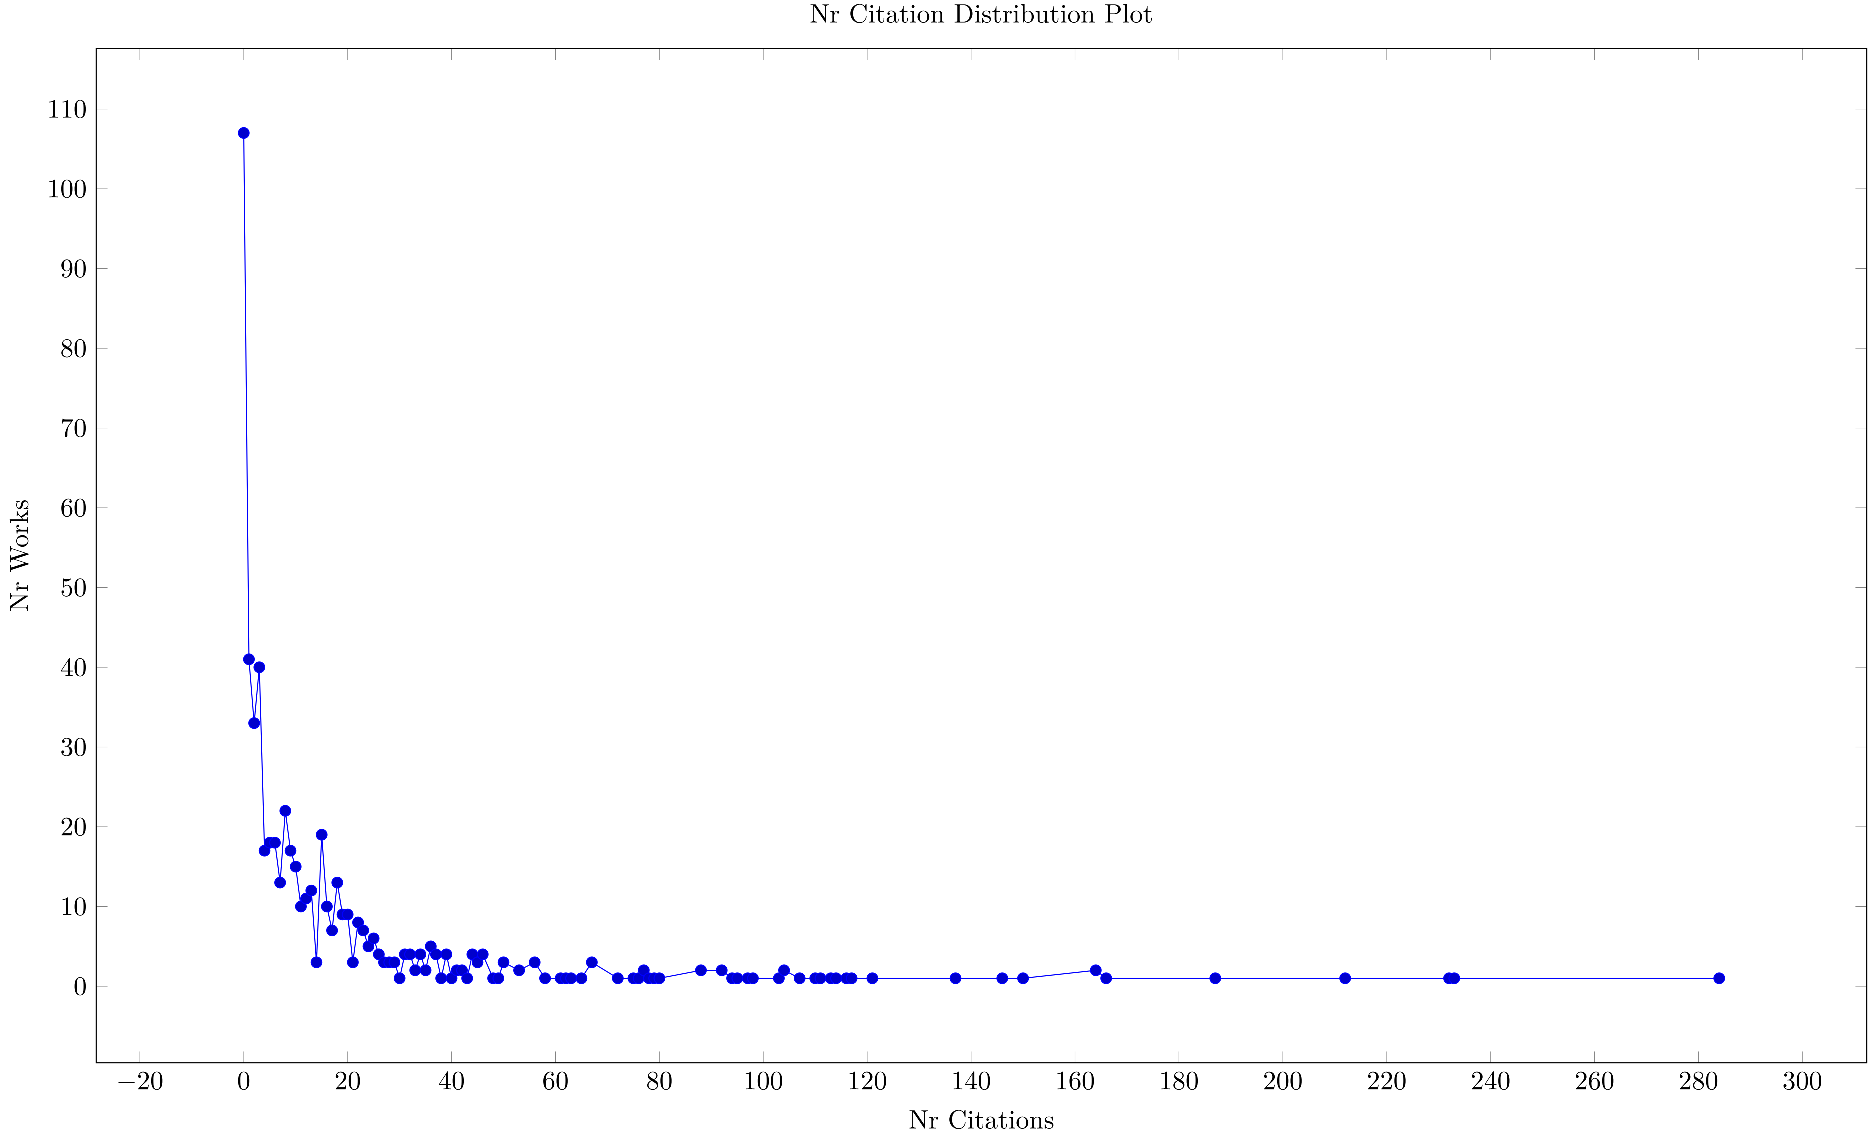
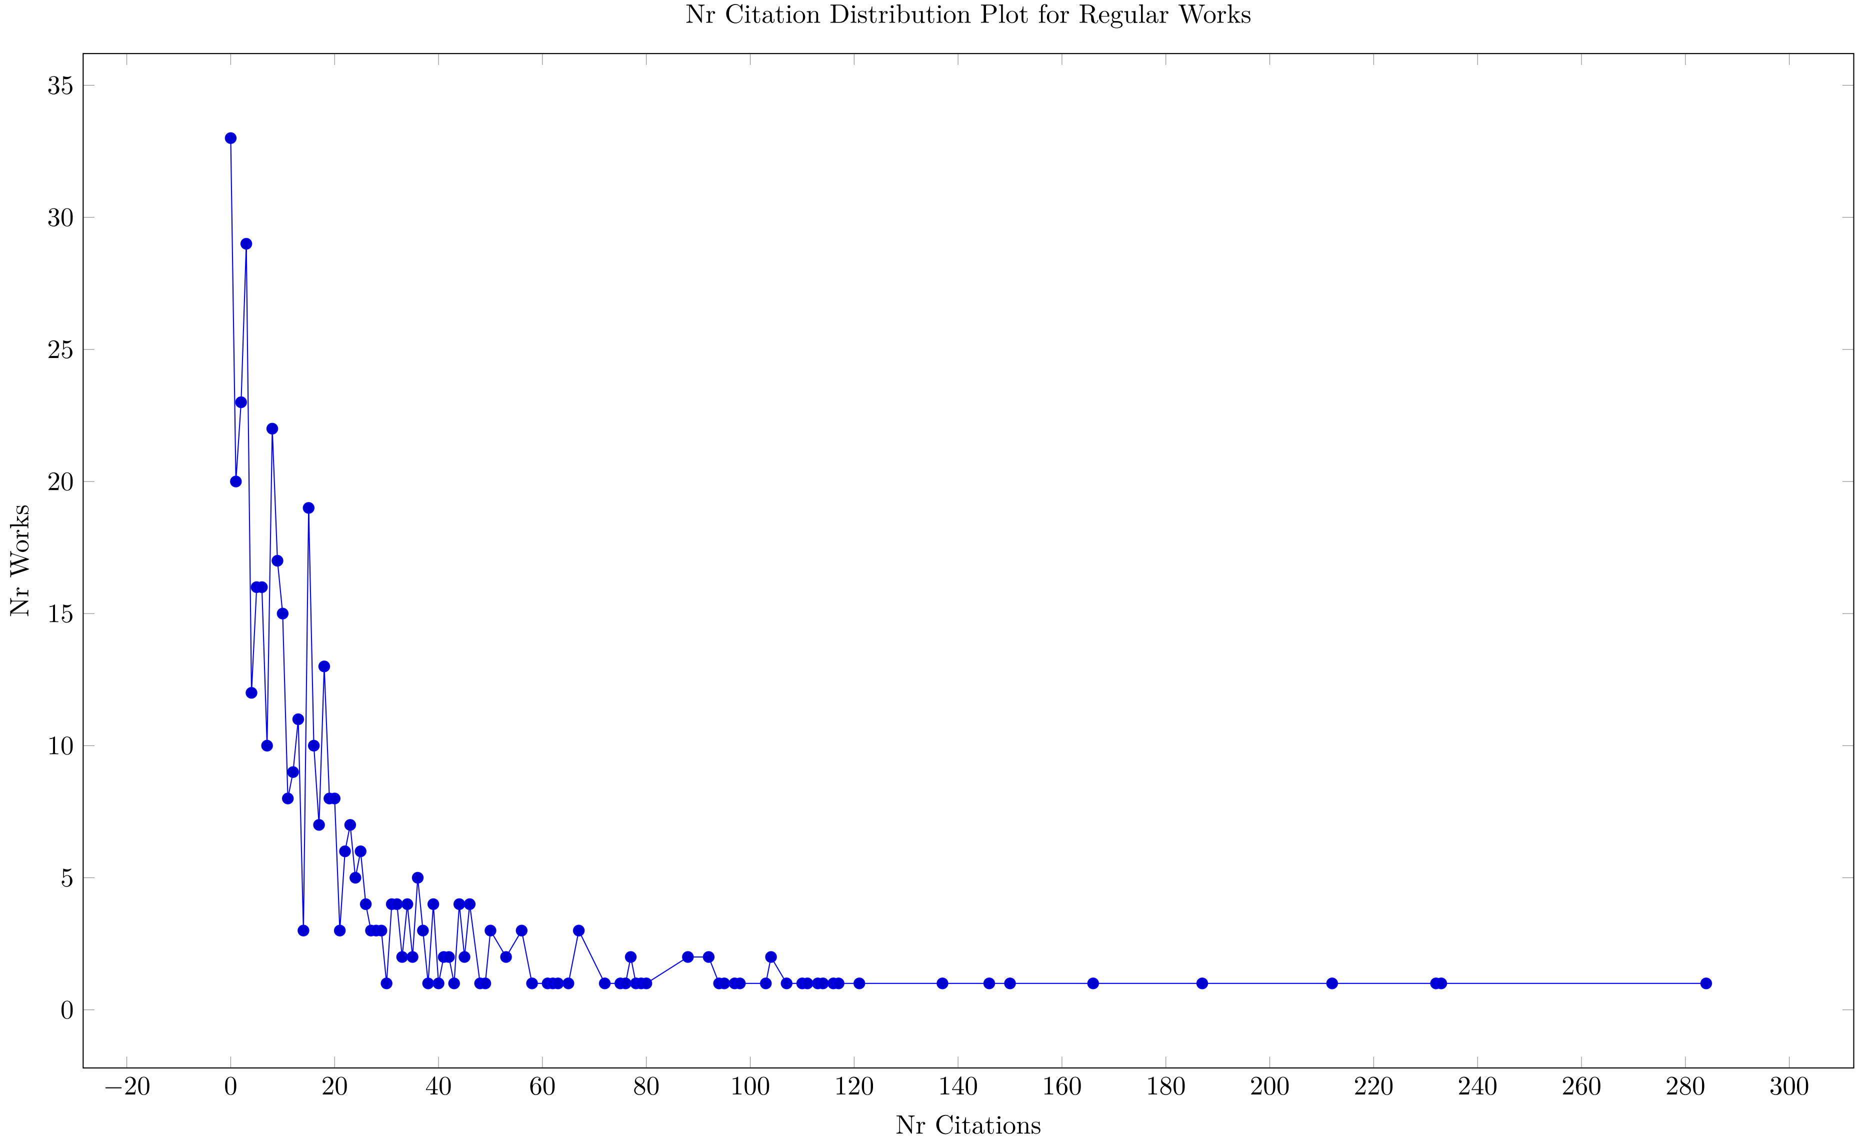
5 Most Cited Works

The first Figure in this section shows the number of works with a given number of citations. There is one paper with over 280 citations, and over 90 works with no recognised citations. Note that the citation count here is the maximum of citations given by the OpenCitations, CrossRef and Scopus meta-data. These numbers are often different from the numbers shown on the SpringerLink website, for which we do not have automated meta-data access.



A large part of the works without citations are PhD announcement and Editorials, as we can see from the next plot. This plot only includes regular papers and surveys, but even here there are quite a few works with only a handful of citations.



The following table lists the top 30 articles by decreasing citation count. This uses the maximum of the three citation counts as criterion. While the details of the ranking are debatable, the overview should give an overall indication of influential papers in the journal's history.

A fundamental issue is that for linked papers we only see the citation count for the journal article, not the total of citations for the conference and the journal together. We are currently not analysing the linked conference papers in detail, but this could be done in the future.

6 Most Connected Works

The following table lists the papers with the highest number of connections within the survey. This is based on the total number of citations of a work by other works in the survey. These numbers are much smaller than the total number of citations, this may not be a good way of ranking works for this specific survey.

Table 54: Most Connected Works (Total 30)

7 Special Issues

This is a list of all special issues of the journal. This data was not available as meta-data, and has been entered by hand, so many interesting fields may be missing.

Table 55: Special Issues (Total 43)

Name	Short Name	Topic	Based on Conference	Nr Articles
Special1	30th Anniv.	30th Anniversary Issue	false	13
Special2	CPAIOR 2020	Special Issue on Fast Track CPAIOR 2020	true	5
Special3	CPAIOR 2018	Special Issue on Fast Track CPAIOR 2018	true	4
Special4	CPAIOR 2017	Special Issue on Fast Track CPAIOR 2017	true	5
Special5	20th Anniv.	20th Anniversary Issue	false	5
Special6	CPAIOR 2016	Fast track issue for CPAIOR 2016	true	4
Special7	CP 2016	Fast track issue for CP 2016	true	5
Special8	CP 2015	CP 2015	true	7
Special9	CPAIOR 2015	Fast track issue for CPAIOR 2015	true	6
Special10	CSP in AI	CSP technologies in artificial intelligence	false	5
Special11	Future	Looking into the crystal-ball: a bright future for CP	false	7
Special12	ModRef	Special issue on constraint modelling and reformulation	false	6
Special13	Plan/Schedule	Constraint satisfaction for planning and scheduling problems	false	5
Special14	Preferences	Special issue on Constraint-based approaches to Preference Modelling and Reasoning	false	6
Special15	CP 2007	Special issue on CP 2007	true	5
Special16	CP 2008	Sspecial issue on CP 2008	true	6
Special17	QCSP	Special issue on quantified CSPs and QBF	false	6
Special18	Modelling	Special Issue on Abstraction and Automation in Constraint Modelling	false	6
Special19	Bio	Special Issue on Bioinformatics and Constraints	false	8
Special20	Global	Special Issue on Global Constraints	false	4
Special21	Local Search	Special Issue on Local Search Techniques in Constraint Satisfaction	false	6
Special22	CPAIOR 2005	Special Issue on CPAIOR 2005	true	6
Special23	CP 2005	Special Issue on CP 2005	true	6
Special24	CP 2002	Special Issue on CP 2002	true	5
Special25	CP 2003	Special Issue on CP 2003	true	5
Special26	CP 2004	Special Issue on CP 2004	true	6
Special27	Interaction	Special Issue on User-Interaction in Constraint Satisfaction	false	5
Special28	Soft	Soft Constraints	false	5
Special29	Agents	Special Issue on Constraint Agents	false	4
Special30	CP 1998/99	CP 1998, CP 1999	true	10
Special31	CP 2000	CP 2000	true	6
Special32	Planning	Special Issue on Planning	false	4
Special33	Bio	Special Issue on Bioinformatics	false	8
Special34	Multimedia	Special Issue on Constraints for Multimedia Artistic Applications	false	6
Special35	Scheduling	Special Issue on Industrial Constraint-Directed Scheduling	false	4
Special36	CP 1997	CP 1997	true	7
Special37	CLP	Constraint Logic Programming	false	5
Special38	CP 1996	CP 1996	true	5
Special39	Graphics	Constraint-based graphics and visualization	false	5
Special40	Temporal	Constraints on Spatial and Temporal Reasoning	false	10
Special41	Interval	Interval Constraints	false	6
Special42	Databases	Constraints and Databases	false	6
Special43	Strategic	Strategic Directions for Computing Science	false	14

8 Articles by SubType

The following tables list papers by sub types, this may be interesting to some readers.

8.1 Application

9 Acronyms

The list of acronyms is obtained from the concept categories, which allows for acronyms to be searched for both by their short and long form.

Table 64: Acronym Concepts

Acronym	Type	Description
2BPHFSP	Classification	Two-Stage Bin Packing and Hybrid Flow Shop Scheduling Problem
AI	CP	Artificial Intelligence
ASP	CP	Answer Set Programming
BDD	CP	Binary decision diagram
BIBD	ApplicationAreas	Balanced Incomplete Block Design
BOM	Concepts	Bill of Material
BPCTOP	Classification	Bulk Port Cargo Throughput Optimisation Problem
CDO	ApplicationAreas	Collateralised debt obligation
CECSP	Classification	Continuous Energy-Constrained Scheduling Problem
CHSP	Classification	Cyclic Hoist Scheduling Problem
CLP	CP	Constraint Logic Programming
COP	CP	Constraint Optimization Problem
COVID	ApplicationAreas	Coronavirus disease
CP	CP	Constraint Programming
CSP	CP	Constraint Satisfaction Problem
CTW	Classification	Cable Tree Wiring Problem
CuSP	Classification	Cumulative Scheduling Problem
DNF	Algorithms	Disjunctive normal form
DPLL	Algorithms	Davis Putnam algorithm
EOSP	Classification	Earth Observation Scheduling Problem
FC	Algorithms	Forward checking
FJS	Classification	Fixed Job Scheduling
GAP	Classification	Generalized Assignment Problem
GCC constraint	Constraints	global cardinality constraint
GCSP	Classification	Group Cumulative Scheduling Problem
GRASP	Algorithms	Greedy Randomized Adaptive Search Procedure
HFF	Classification	Hybrid Flexible Flow-shop
HFFTT	Classification	Hybrid Flexible Flowshop with Transportation Times
HFS	Classification	Hybrid Flow-shop Problem
HVAC	ApplicationAreas	Heating Ventilation Air-Conditioning
IGT	Algorithms	Improved Guo Tao algorithm
JSPT	Classification	Job-Shop Scheduling Problem with Transportation
JSSP	Classification	Job-Shop Scheduling Problem
KRFP	Classification	kernel resource feasibility problem
LP	CP	Linear Programming
LSFRP	Classification	Liner Shipping Fleet Repositioning Problem
MAC	Algorithms	Maintaining arc consistency
MDD	CP	Multivalued decision diagram
MGAP	Classification	Modified Generalized Assignment Problem
MILP	CP	Mixed Integer Linear Programming
MINLP	Algorithms	Mixed-Integer Non-linear Programming
MIP	CP	Mixed Integer Programming
MIQP	Algorithms	Mixed-Integer Quadratic Programming
MaxSAT	CP	Maximum Satisfiability
NEH	Algorithms	Scheduling Algorithm developed by Nawaz, Enscore, Ham
OPD	ApplicationAreas	Optimal portfolio design
OSP	Classification	Oven Scheduling Problem
OSSP	Classification	Open Shop Scheduling Problem
PCB industry	Industries	printed circuit board industry
PD	ApplicationAreas	Portfolio design

Table 64: Acronym Concepts

Acronym	Type	Description
PJSSP	Classification	Pre-emptive Job-Shop scheduling Problem
PMSP	Classification	Parallel Machine Scheduling Problem
PP-MS-MMRCPSP	Classification	partially preemptive- multi-skill/mode resource-constrained project scheduling problem with generalized precedence relations and resource calendars
PTC	Classification	Scheduling Problem with Time Constraints
RCMPSP	Classification	Resource-Constrained Multi-Project Scheduling Problem
RCPSP	Classification	Resource-constrained Project Scheduling Problem
RCPSPDC	Classification	Resource-constrained Project Scheduling Problem with Discounted Cashflow
RTMP	Classification	Railway Traffic Management Problem
RWA	ApplicationAreas	Routing and wavelength assignment
SAT	CP	Satisfiability
SBSFMMAL	Classification	Simultaneous Balancing and Scheduling of Flexible Mixed Model Assembly Lines
SCC	Classification	Steel-making and continuous casting
SMSDP	Classification	steel mill slab design problem
TCSP	Classification	Temporal Constraint Satisfaction Problem
TMS	Classification	Transmission Network Maintenance Planning
TSP	ApplicationAreas	Traveling salesman problem
UTVPI constraint	Constraints	unit two variable per inequality constraint
WCSP	CP	Weighted Constraint Satisfaction Problem
psplib	Classification	Project Scheduling Problem Library
rtRTMP	Classification	real-time Railway Traffic Management Problem

10 Concept Matching

In order to automatically find out properties of the articles, we try to find certain concepts in the pdf versions of the articles. We manually defined an ontology of important concepts to look for, and defined regular expressions that would recognize these concepts in the text. We use the *pdfgrep* command to search for the number of occurrences of certain regular expressions in the files. This often clearly identifies the constraints used in the model. We group the results by number of occurrences of the concept in the text of the work. Note that this is only approximate, as we do include the full pdf file in the search. A concept might only be mentioned in some of the title of citations used in the paper, we do count them in our results, as we were not able to remove the bibliography from the main body of the work.

Overall, if a work is not mentioned as using the concept, the the text does not contain a match to the corresponding regular expression. A fundamental limitation of this approach is that it only really works for text written in the language the regular expressions are designed for (in our case English), and not those written in another language. We could overcome this limitation by defining all concepts in other languages as well, and then using a language flag to identify the language the text is written in.

Note that we only show the first 30 matching entries in each concept category, and list the total number of matches if there are more than 30 matches.

10.1 Concept Type CP

Table 65: Works for Concepts of Type CP (Total 45 Concepts, 45 Used)

A Papers and Articles Missing a Local Copy

This section lists all papers and articles for which we were not able to locate an electronic copy that we could download to our system. This might be because the work is behind a paywall for which we do not have access, or since the paper only exists in hardcopy, for works from the start of the period covered. As in either case we are not able to extract useful information from the work, either automatically, or manually, without the actual text itself, these gaps should be closed where possible.

Some journals are highlighted in red, indicating that I cannot read these through our library. This helps to avoid repeatedly checking whether I can access the papers via the publication URL. The highlighting is controlled by the blocked.json file in the imports/ directory.

B Papers and Articles Without Recognized Concepts

This section lists papers and articles for which we have a pdf local copy, but where we were not able to extract any of the defined concepts. This can basically have two reasons. We either have included a paper which is not related to any of the defined topics, so that none of the defined concepts occur in the paper. A more likely cause is that the pdf file is a scanned document for which optical character recognition was not run or was not successful, so that the pdf consists of a series of bitmap images. In that case, pdfgrep is unable to find any text in the document, and no matches for concepts are found. It may be useful to check the pdf files to see if that is the case.

B.1 Irrelevant Work Suspects

The works in the following table might be irrelevant, as their computed relevance for the body text is very low. Works that do not have a local copy or that only are one or two pages long are excluded from this analysis. Note that this might also mean that we have to add more concepts.

Table 82: Works that might be Irrelevant (Total 30)

B.2 Works with Few Extracted Concepts

These works do match only few concepts, they might be discussing other topics that should be included in the list of concepts, or they might be irrelevant, and included in the survey by mistake.

C Unmatched Concepts

This section lists those concepts for which no matches were found. The most likely cause is a mistake in the regular expression used to find the concept, but it is also possible that some concept simply is not mentioned in any of the documents.

D Highly Connected Missing Works

The following table shows work currently not considered which are highly connected to the survey, but which do not have a high enough relevance to be included automatically. The top 50 entries are shown. Some of these work may be background material cited by many works in the survey, or we might be missing some concepts to show that they are relevant to the survey topic.

For this specific survey must of the works shows are highly relevant to Constraint Programming, but have not been included as they were not published in the Constraints Journal.

Table 87: Highly Connected Missing Work Not Considered Relevant (Total 11794 Works Checked, 50 Selected)

Constraints are everywhere: most computational problems can be described in terms of restrictions imposed on the set of possible solutions, and constraint programming is a problem-solving technique that works by incorporating those restrictions in a programming environment. It draws on methods from combinatorial optimisation and artificial intelligence, and has been successfully applied in a number of fields from scheduling, computational biology, finance, electrical engineering and operations research through to numerical analysis. This textbook for upper-division students provides a thorough and structured account of the main aspects of constraint programming. The author provides many worked examples that illustrate the usefulness and versatility of this approach to programming, as well as many exercises throughout the book that illustrate techniques, test skills and extend the text. Pointers to current research, extensive historical and bibliographic notes, and a comprehensive list of references will also be valuable to professionals in computer science and artificial intelligence.

Many science and engineering applications require the user to find solutions to systems of nonlinear constraints or to optimize a nonlinear function subject to nonlinear constraints. The field of global optimization is the study of methods to find all solutions to systems of nonlinear constraints and all global optima to optimization problems. Numerica is modeling language for global optimization that makes it possible to state nonlinear problems in a form close to the statements traditionally found in textbooks and scientific papers. The constraint-solving algorithm of Numerica is based on a combination of traditional numerical methods such as interval and local methods, and constraint satisfaction techniques. This comprehensive presentation of Numerica describes its design, functions, and implementation. It also discusses how to use Numerica effectively to solve practical problems and reports a number of experimental results. A commercial implementation of Numerica is available from ILOG under the name ILOG Numerica.

This article presents a model and implementation techniques for speeding up constraint propagation. Three fundamental approaches to improving constraint propagation based on propagators as implementations of constraints are explored: keeping track of which propagators are at fixpoint, choosing which propagator to apply next, and how to combine several propagators for the same constraint. We show how idempotence reasoning and events help track fixpoints more accurately. We improve these methods by using them dynamically (taking into account current variable domains to improve accuracy). We define priority-based approaches to choosing a next propagator and show that dynamic priorities can improve propagation. We illustrate that the use of multiple propagators for the same constraint can be advantageous with priorities, and introduce staged propagators that combine the effects of multiple propagators with priorities for greater efficiency.

The goal of this paper is to develop models and methods that use complementary strengths of Mixed Integer Linear Programming (MILP) and Constraint Programming (CP) techniques to solve problems that are otherwise intractable if solved using either of the two methods. The class of problems considered in this paper have the characteristic that only a subset of the binary variables have non-zero objective function coefficients if modeled as an MILP. This class of problems is formulated as a hybrid MILP/CP model that involves some of the MILP constraints, a reduced set of the CP constraints, and equivalence relations between the MILP and the CP variables. An MILP/CP based decomposition method and an LP/CP-based branch-and-bound algorithm are proposed to solve these hybrid models. Both these algorithms rely on the same relaxed MILP and feasibility CP problems. An application example is considered in which the least-cost schedule has to be derived for processing a set of orders with release and due dates using a set of dissimilar parallel machines. It is shown that this problem can be modeled as an MILP, a CP, a combined MILP-CP OPL model (Van Hentenryck 1999), and a hybrid MILP/CP model. The computational performance of these models for several sets shows that the hybrid MILP/CP model can achieve two to three orders of magnitude reduction in CPU time.

We introduce a general framework for constraint satisfaction and optimization where classical CSPs, fuzzy CSPs, weighted CSPs, partial constraint satisfaction, and others can be easily cast. The framework is based on a semiring structure, where the set of the semiring specifies the values to be associated with each tuple of values of the variable domain, and the two semiring operations (+ and X) model constraint projection and combination respectively. Local consistency algorithms, as usually used for classical CSPs, can be exploited in this general framework as well, provided that certain conditions on the semiring operations are satisfied. We then show how this framework can be used to model both old and new constraint solving and optimization schemes, thus allowing one to both formally justify many informally taken choices in existing schemes, and to prove that local consistency techniques can be used also in newly defined schemes.

Because of their occasional need to return to shallow points in a search tree, existing backtracking methods can sometimes erase meaningful progress toward solving a search problem. In this paper, we present a method by which backtrack points can be moved deeper in the search space, thereby avoiding this difficulty. The technique developed is a variant of dependency-directed backtracking that uses only polynomial space while still providing useful control information and retaining the completeness guarantees provided by earlier approaches.
